Abstract

Let $c > 0$, and H be a fixed graph of order r . Every graph on n vertices containing at least cn^r copies of H contains a “blow-up” of H with $r - 1$ vertex classes of size $\lfloor c^{r^2} \ln n \rfloor$ and one vertex class of size greater than $n^{1-c^{r-1}}$. A similar result holds for induced copies of H .

Keywords: *number of subgraphs; blow-up of a graph; induced subgraphs.*

Main results

This note is part of an ongoing project aiming to renovate some classical results in extremal graph theory, see, e.g., [?] and [3, 6].

Suppose that a graph G of order n contains cn^r copies of a given subgraph H on r vertices. How large “blow-up” of H must G contain? When H is an r -clique, this question was answered in [3]: G contains a complete r -partite graph with $r - 1$ parts of size $\lfloor c^r \ln n \rfloor$ and one part larger than $n^{1-c^{r-1}}$.

The aim of this note is to answer this question for any subgraph H .

We first define precisely a “blow-up” of a graph: given a graph H of order r and positive integers x_1, \dots, x_r , we write $H(x_1, \dots, x_r)$ for the graph obtained by replacing each vertex $u \in V(H)$ with a set V_u of size x_u and each edge $uv \in E(H)$ with a complete bipartite graph with vertex classes V_u and V_v .

Theorem 1 *Let $r \geq 2$, $0 < c \leq 1/2$, H be a graph of order r , and G be a graph of order n . If G contains more than cn^r copies of H , then $H(s, \dots, s, t) \subset G$, where $s = \lfloor c^{r^2} \ln n \rfloor$ and $t > n^{1-c^{r-1}}$.*

To state a similar theorem for induced subgraphs, we introduce a new concept: we say that a graph X is of type $H(x_1, \dots, x_r)$, if X is obtained from $H(x_1, \dots, x_r)$ by adding some edges within the sets V_u , $u \in V(H)$.

Theorem 2 *Let $r \geq 2$, $0 < c \leq 1/2$, H be a graph of order r , and G be a graph of order n . If G contains more than cn^r induced copies of H , then G contains an induced subgraph of type $H(s, \dots, s, t)$, where $s = \lfloor c^{r^2} \ln n \rfloor$ and $t > n^{1-c^{r-1}}$.*

The proofs of Theorems 1 and 2 are almost identical; we shall present only the proof of Theorem 2, for it needs more care.

Our notation follows [1]. Thus $V(G)$ and $E(G)$ denote the vertex and edge sets of a graph G and $e(G) = |E(G)|$. The subgraph induced by $X \subset V(G)$ is denoted by $G[X]$.

Specific notation

Suppose G and H are graphs, and X is an induced subgraph of H .

We write $H(G)$ for the set of injections $h : H \rightarrow G$, such that $\{u, v\} \in E(H)$ if and only if $\{h(u), h(v)\} \in E(G)$.

We say that $P \in H(G)$ extends $R \in X(G)$, if $R = P|V(X)$.

Suppose $M \subset H(G)$.

We let

$$X(M) = \{R : (R \in X(G)) \ \& \ (\text{there exists } P \in M \text{ extending } R)\}.$$

For every $R \in X(M)$, we let

$$d_M(R) = |\{P : (P \in M) \ \& \ (P \text{ extends } R)\}|.$$

Suppose Y is a subgraph of G of type $H(s_1, \dots, s_r)$ and $s = \min\{s_1, \dots, s_r\}$.

We say that M covers Y if:

(a) for every edge ij going across vertex classes of Y , there exists $h \in K_2(M)$ mapping some edge of H onto ij ;

(b) there exists $h_1, \dots, h_s \in M$, such that $h_i(H) \cap h_j(H) = \emptyset$ for $i \neq j$, and for all $i \in [s]$, $h_i(H)$ intersects all vertex classes of Y .

We deduce Theorem 2 from the following technical statement.

Theorem 3 *Let $r \geq 2$, $0 < c \leq 1/2$, H be a graph of order r , and G be a graph of order n . If $M \subset H(G)$ and $|M| \geq cn^r$, then M covers an induced subgraph of type $H(s, \dots, s, t)$ with $s = \lfloor c^{r^2} \ln n \rfloor$ and $t > n^{1-c^{r-1}}$.*

The proof of Theorem 3 is based on the following routine lemma.

Lemma 4 *Let F be a bipartite graph with parts A and B . Let $|A| = m$, $|B| = n$, $r \geq 2$, $0 < c \leq 1/2$, and $s = \lfloor c^{r^2} \ln n \rfloor$. If $s \leq (c/2^r)m + 1$ and $e(F) \geq (c/2^{r-1})mn$, then F contains a $K_2(s, t)$ with parts $S \subset A$ and $T \subset B$ such that $|S| = s$ and $|T| = t > n^{1-c^{r-1}}$.*

Proof Let

$$t = \max\{x : \text{there exists } K_2(s, x) \subset F \text{ with part of size } s \text{ in } A\}.$$

For any $X \subset A$, write $d(X)$ for the number of vertices joined to all vertices of X . By definition, $d(X) \leq t$ for each $X \subset A$ with $|X| = s$; hence,

$$t \binom{m}{s} \geq \sum_{X \subset A, |X|=s} d(X) = \sum_{u \in B} \binom{d(u)}{s}. \quad (1)$$

Following [2], p. 398, set

$$f(x) = \begin{cases} \binom{x}{s} & \text{if } x \geq s-1 \\ 0 & \text{if } x < s-1, \end{cases}$$

and note that $f(x)$ is a convex function. Therefore,

$$\sum_{u \in B} \binom{d(u)}{s} = \sum_{u \in B} f(d(u)) \geq n f\left(\frac{1}{n} \sum_{u \in B} d(u)\right) = n \binom{e(F)/n}{s} \geq n \binom{cm/2^{r-1}}{s}.$$

Combining this inequality with (1), and rearranging, we find that

$$\begin{aligned} t &\geq n \frac{(cm/2^{r-1})(cm/2^{r-1}-1) \cdots (cm/2^{r-1}-s+1)}{m(m-1) \cdots (m-s+1)} > n \left(\frac{cm/2^{r-1}-s+1}{m}\right)^s \\ &\geq n \left(\frac{c}{2^r}\right)^s \geq n (e^{\ln(c/2^r)})^{c^{r^2} \ln n} = n^{1+c^{r^2} \ln(c/2^r)} = n^{1+2^r c^{r^2-1} (c/2^r) \ln(c/2^r)}. \end{aligned}$$

Since $c/2^r \leq 1/8 < 1/e$ and $x \ln x$ is decreasing for $0 < x < 1/e$, we see that

$$t > n^{1+2^r c^{r^2-1} (c/2^r) \ln(c/2^r)} \geq n^{1-(r+1)c^{r^2-1}(1/2) \ln 2} > n^{1-c^{r-1}(r+1)2^{-r^2+r}(1/2) \ln 2}.$$

Now, $t > n^{1-c^{r-1}}$ follows, in view of

$$\frac{2^{r^2-r}}{r+1} \geq \frac{1}{2 \ln 2},$$

completing the proof. □

Proof of Theorem 3 Let $M \subset H(G)$ satisfy $|M| \geq cn^r$. We shall use induction on r to prove that M covers an induced subgraph of type $H(s, \dots, s, t)$ with $s = \lfloor c^{r^2} \ln n \rfloor$ and $t > n^{1-c^{r-1}}$.

Assume $r = 2$ and let A and B be two disjoint copies of $V(G)$. We can suppose that $H = K_2$, as otherwise we apply the subsequent argument to the complement of G .

Define a bipartite graph F with parts A and B , joining $u \in A$ to $v \in B$ if $uv \in M$. Set $s = \lfloor c^4 \ln n \rfloor$ and note that $s \leq (c/4)n + 1$. Since $e(F) = |M| \geq cn^2 > (c/2)n^2$, Lemma 4 implies that F contains a $K_2(s, t)$ with $t > n^{1-c}$. Hence M covers an induced graph of type $K_2(s, t)$, proving the assertion for $r = 2$. Assume the assertion true for $2 \leq r' < r$.

Let $V(H) = \{v_1, \dots, v_r\}$ and $H' = H[\{v_1, \dots, v_{r-1}\}]$.

We first show that there exists $L \subset M$ with $|L| > (c/2)n^r$ such that $d_L(R) > (c/2)n$ for all $R \in H'(L)$. Indeed, set $L = M$ and apply the following procedure.

While there exists an $R \in H'(L)$ with $d_L(R) \leq (c/2)n$ **do**

Remove from L all members extending R .

When this procedure stops, we have $d_L(R) > (c/2)n$ for all $R \in H'(L)$, and also

$$|M| - |L| \leq cn |H'(M)| < \frac{c}{2} n \cdot n^{r-1},$$

giving $|L| > (c/2)n^r$, as claimed.

Since $H'(L) \subset H'(G)$ and

$$|H'(L)| \geq |L|/n > (c/2)n^r/n = (c/2)n^{r-1},$$

the induction assumption implies that $H'(L)$ covers an induced subgraph $Z \subset G$ of type $H'(p, \dots, p)$ with $p = \lfloor c^{(r-1)^2} \ln n \rfloor$. Here we use the inequalities

$$n^{1-c^{r-2}} \geq n^{1-c} \geq n^{1/2} > 2^{-4} \ln n \geq c^{(r-1)^2} \ln n.$$

Since $H'(L)$ covers Z , there exist $R_1, \dots, R_p \in H'(L)$ such that $R_1(H'), \dots, R_p(H')$ are disjoint subgraphs of Z intersecting all its vertex classes. For every $i \in [p]$, let

$$W_i = \{v : (\text{there exists } P \in L \text{ extending } R_i) \ \& \ (P(v_r) = v)\}.$$

Write d for the degree of v_r in H and note that each $v \in W_i$ is joined to exactly d vertices of $R_i(H')$. Since, by our selection, $d_L(R_i) \geq (c/2)n$ for all $i \in [p]$, there is a set $X_i \subset W_i$ with

$$|X_i| \geq (cn/2) / \binom{r-1}{d} \geq cn/2^{r-1}$$

such that the vertices of X_i have the same neighbors in $R_i(H')$. Let $Y_i \subset [r-1]$ be the set of classes of Z containing the neighbors of the vertices of X_i .

Next, set $m = \lfloor p/2^{r-2} \rfloor$, and note that there is a set $A \subset [r-1]$ with $|A| = m$ such that all sets $Y_i, i \in A$, are the same.

Define a bipartite graph F with parts A and $B = V(G)$, joining $i \in A$ to $v \in B$ if $v \in X_i$. Since $|X_i| > (c/2^{r-1})n$ for all $i \in A$, we have

$$e(F) > (c/2^{r-1})mn.$$

Also, setting $s = \lfloor c^{r^2} \ln n \rfloor$, we find that

$$\begin{aligned} s &\leq c^{r^2} \ln n = c^{2r-1} c^{(r-1)^2} \ln n \leq (c/2^{2r-2}) \lfloor c^{(r-1)^2} \ln n \rfloor + 1 \\ &\leq (c/2^r) p/2^{r-2} + 1 \leq (c/2^r) m + 1. \end{aligned}$$

Therefore, by Lemma 4, there exists $K_2(s, t) \subset F$ with parts $S \subset A$ and $T \subset B$ such that $|S| = s$ and $|T| = t > n^{1-c^{r-1}}$.

Let $G' = G[\cup_{i \in S} R_i(H')]$ and $G'' = G[\cup_{i \in S} R_i(H') \cup T]$. Note that $G' \subset Z$, and clearly G' is of type $H'(s, \dots, s)$. Since each vertex $v \in T$ is joined to exactly the same vertices of $\cup_{i \in S} R_i(H')$, we see that G'' is of type $H(s, \dots, s, t)$.

To finish the proof, we show that L covers G'' . First, we see that, for every edge ij going across vertex classes of G'' , there exists $h \in K_2(L)$ mapping some edge of H onto ij . Finally, taking s distinct vertices $u_1, \dots, u_s \in T$, by the construction of T , for every $i \in S$, there exists $P_i \in L$ with $P_i|V(X) = R_i$ and $P_i(v_r) = u_i$. Hence, L covers G'' , completing the induction step and the proof. \square

Concluding remarks

Using random graphs, it is easy to see that most graphs on n vertices contain substantially many copies of any fixed graph, but contain no $K_2(s, s)$ for $s \gg \log n$. Hence, Theorems 1, 2, and 3 are essentially best possible.

Finally, a word about the project mentioned in the introduction: in this project we aim to give wide-range results that can be used further, adding more integrity to extremal graph theory.
