REALIZATION OF TENSOR-PRODUCT AND OF TENSOR-FACTORIZATION OF RATIONAL FUNCTIONS

DANIEL ALPAY AND IZCHAK LEWKOWICZ

Abstract. We here first study the state space realization of a tensor-product of a pair of rational functions. At the expense of "inflating" the dimensions, we recover the classical expressions for realization of a regular product of rational functions. Then, under an additional assumption that the limit at infinity of a given rational function exists and is equal to identity, an explicit formula for a *tensor-factorization* of this function, is introduced.

1. INTRODUCTION

The problem of minimal factorization of matrix-valued rational functions of one complex variable has along history; see for instance $(1, 2, 6)$ $(1, 2, 6)$ $(1, 2, 6)$. Less known seems to be the counterpart of this problem when matrix product is replaced by tensor product. More precisely, we study the following two problems: First, given two rational matrix-valued functions R_1 and R_2 analytic at infinity, write a realization of the tensor product $R_1 \otimes R_2$ in terms of realizations of R_1 and R_2 . Next, given a matrix-valued rational function R analytic at infinity, find its representations as $R_1 \otimes R_2$ where R_1 and R_2 are rational and analytic at infinity.

To provide some motivation we note the following. Tensor products play an important role in mathematics and quantum mechanics. In the latter case, a first example (see e.g. [\[4,](#page-9-3) p. 162]) is the product of two wave functions, each belonging to a given Hilbert space, which belongs to the tensor product of the given Hilbert spaces; see e.g. [\[8,](#page-9-4) Proposition 6.2, p. 111] for the latter. Another example is the case of quantum states (positive matrices with trace equal to 1; see e.g. [\[9\]](#page-9-5)). Given two states $M_1 \in \mathbb{C}^{N_1 \times N_1}$ and $M_2 \in \mathbb{C}^{N_2 \times N_2}$, of possibly different sizes, the tensor product $M_1 \otimes M_2$ is still a state. Note that if $M = M_1 \otimes M_2$, one can recover M_1 and M_2 uniquely via the formula

(1.1)
$$
d_1^* M_1 c_1 = \sum_{k=1}^{N_2} (d_1 \otimes f_k)^* M(c_1 \otimes f_k), \quad c_1, d_1 \in \mathbb{C}^{N_1},
$$

where f_1, \ldots, f_{N_2} denotes an orthonormal basis for \mathbb{C}^{N_2} , and similarly for M_2 ,

(1.2)
$$
d_2^* M_2 c_2 = \sum_{k=1}^{N_1} (e_k \otimes d_2)^* M(e_k \otimes c_2), \quad c_2, d_2 \in \mathbb{C}^{N_2},
$$

where now e_1, \ldots, e_{N_1} is an orthonormal basis for \mathbb{C}^{N_1} . See e.g. [\[9,](#page-9-5) eq. (9.2.1) p. 97].

Daniel Alpay thanks the Foster G. and Mary McGaw Professorship in Mathematical Sciences, which supported this research.

If one starts from an arbitrary state $M \in \mathbb{C}^{N_1 N_2 \times N_1 N_2}$ the matrices defined by [\(1.1\)](#page-0-0) and [\(1.2\)](#page-0-1) will be states, called marginal states, but their tensor product need not be equal to M .

One can consider similar problems in the setting of functions. We focus the discussion on rational functions. If $R(z)$ is a $\mathbb{C}^{N\times N}$ -valued rational function and if $N = N_1N_2$, formulas [\(1.1\)](#page-0-0) and [\(1.2\)](#page-0-1) now define two rational functions R_A and R_B , respectively $\mathbb{C}^{N_1 \times N_1}$ and $\mathbb{C}^{N_1 \times N_1}$ -valued, via

(1.3)

$$
d_1^* R_A(z) c_1 = \sum_{k=1}^{N_2} (d_1 \otimes f_k)^* R(z) (c_1 \otimes f_k),
$$

$$
d_2^* R_B(z) c_2 = \sum_{k=1}^{N_2} (d_2 \otimes f_k)^* R(z) (c_2 \otimes f_k),
$$

If $R = R_1 \otimes R_2$ where R_1 is $\mathbb{C}^{N_1 \times N_1}$ -valued and R_2 is $\mathbb{C}^{N_2 \times N_2}$ -valued, then these equations can be rewritten as

(1.4)
$$
R_A(z) = R_1(z) \cdot (\text{Tr } R_2(z))
$$

$$
R_B(z) = R_2(z) \cdot (\text{Tr } R_1(z))
$$

and so these equations basically solve the tensor factorization problem.

The purpose of this work is in a somewhat different direction; we would like to express both tensor multiplication and tensor factorization of matrix-valued rational functions using state space representations.

In the rest of this section we cite some known results. Let z_l , z_r (the subscript stands for "left" and "right") be a pair of complex variables, and let $F_l(z_l)$, $F_r(z_r)$ be a pair of $p_l \times m_l$, $p_r \times m_r$ -valued rational functions, respectively. Assume that neither has poles at infinity and denote by n_l , n_r the respective McMillan degrees. Thus, one can write the rational functions and the respective realization as

(1.5)
\n
$$
F_l(z_l) = D_l + C_l (z_l I_{n_l} - A_l)^{-1} B_l \t F_r(z_r) = D_r + C_r (z_r I_{n_r} - A_r)^{-1} B_r
$$
\n
$$
R_{F_l} = \left(\frac{A_l}{C_l} \frac{B_l}{D_l}\right) \t R_{F_r} = \left(\frac{A_r}{C_r} \frac{B_r}{D_r}\right).
$$

Recall that whenever $m_l = p_r$ the product $F_l(z_l)F_r(z_r)$ is well-defined and its realization is given by^{[1](#page-1-0)} (see e.g. [\[3,](#page-9-6) Section 2.5])

(1.6)
$$
R_{F_l F_r} = \begin{pmatrix} A_l & B_l C_r & B_l D_r \ 0 & A_r & B_r \ \hline C_l & D_l C_r & D_l D_r \end{pmatrix} = \begin{pmatrix} A & B \ C & D \end{pmatrix} = \begin{pmatrix} A_l & 0 & B_l \ 0 & I_{nr} & 0 \ C_l & 0 & D_l \end{pmatrix} \begin{pmatrix} I_{n_l} & 0 & 0 \ 0 & A_r & B_r \ 0 & C_r & D_r \end{pmatrix},
$$

in the sense that

$$
(1.7) \ \ F_1(z_1)F_2(z_2) = D_1D_2 + (C_1 \quad D_1C_2) \left(\begin{pmatrix} z_1I_{n_1} & 0 \\ 0 & z_2I_{n_2} \end{pmatrix} - \begin{pmatrix} A_1 & 0 \\ 0 & A_2 \end{pmatrix} \right)^{-1} \begin{pmatrix} B_1D_2 \\ B_2 \end{pmatrix}.
$$

If $z_l = z_r$ the sought realization in [\(1.6\)](#page-1-1) is of McMillan degree

$$
n_l+n_r.
$$

¹ Strictly speaking, in the references it was formulated for $z_l = z_r = z$ i.e. for $F_l(z)F_r(z)$

when minimal (roughly speaking when there is no pole-zero cancelation). We next address ourselves to the *tensor product*^{[2](#page-2-0)} of $F_l(z_l)$ and $F_r(z_r)$, resulting in $F_l \otimes F_r$, a $p_l p_r \times m_l m_r$ -valued rational function. Tensor product of rational functions is discussed in [\[5,](#page-9-7) Section 5.2].

So far for known results. In the next section we focus on $R_{F_l\otimes F_r}$, the state space realization of $F_l \otimes F_r$. In Section 3 we set the framework for the main result, which is the factorization result presented in Section 4.

2. Realization of a tensor-product of rational functions

We start with technicalities: We denote by boldface characters, "inflated version" of the original ones, i.e.

$$
\mathbf{A}_{\mathbf{I}} := A_l \otimes I_{p_r} \qquad \mathbf{A}_{\mathbf{r}} := I_{m_l} \otimes A_r
$$
\n
$$
\mathbf{B}_{\mathbf{I}} := B_l \otimes I_{p_r} \qquad \mathbf{B}_{\mathbf{r}} := I_{m_l} \otimes B_r
$$
\n
$$
\mathbf{C}_{\mathbf{I}} := C_l \otimes I_{p_r} \qquad \mathbf{C}_r := I_{m_l} \otimes C_r
$$
\n
$$
\mathbf{D}_{\mathbf{I}} := D_l \otimes I_{p_r} \qquad \mathbf{D}_{\mathbf{r}} := I_{m_l} \otimes C_r
$$
\n
$$
\mathbf{F}_{\mathbf{I}}(z_l) := \mathbf{C}_{\mathbf{I}} (z_l I_{n_l p_r} - \mathbf{A}_{\mathbf{I}})^{-1} \mathbf{B}_{\mathbf{I}} + \mathbf{D}_{\mathbf{I}} \qquad \mathbf{F}_{\mathbf{r}}(z_r) := \mathbf{C}_{\mathbf{r}} (z_l I_{m_l n_r} - \mathbf{A}_{\mathbf{r}})^{-1} \mathbf{B}_{\mathbf{r}} + \mathbf{D}_{\mathbf{r}}.
$$

We then show that at the expense of "inflating" the dimensions one can replace a tensor product by a usual product.

Proposition 2.1. Let $F_l(z_r)$, $F_r(z_r)$ be a pair of $p_l \times m_l$, $p_r \times m_r$ -valued rational functions, of McMillan degree n_l , n_r , respectively, whose realization is given in Eq. [\(1.5\)](#page-1-2). Following Eqs. (1.6) and (2.8) , one has that,

$$
(2.9) \t\t R_{F_l \otimes F_r} = R_{\mathbf{F}_1 \mathbf{F}_r}.
$$

In order to go into details we shall repeatedly use the fact, see e.g. [\[7,](#page-9-8) Lemma 4.2.10], that for matrices $T \in \mathbb{C}^{n \times m}$, $X \in \mathbb{C}^{m \times \overline{l}}$, $Y \in \mathbb{C}^{l \times p}$, $Z \in \mathbb{C}^{p \times q}$ one has that

(2.10)
$$
TX \otimes YZ = (T \otimes Y)(X \otimes Z).
$$

We now explicitly compute the tensor product of $F_l(z_l)$ and $F_r(z_r)$,

$$
F_l \otimes F_r = \left(D_l + C_l (z_l I_{n_l} - A_l)^{-1} B_l \right) \otimes \left(D_r + C_r (z_r I_{n_r} - A_r)^{-1} B_r \right)
$$

= $D_l \otimes D_r + D_l \otimes \left(C_r (z_r I_{n_r} - A_r)^{-1} B_r \right) + \left(C_l (z_l I_{n_l} - A_l)^{-1} B_l \right) \otimes D_r + \left(C_l (z_l I_{n_l} - A_l)^{-1} B_l \right) \otimes \left(C_r (z_r I_{n_r} - A_r)^{-1} B_r \right)$

We next separately examine each block

$$
D_l \otimes (C_r(z_rI_{n_r}-A_r)^{-1}B_r) = D_lI_{m_l} \otimes (C_r(z_rI_{n_r}-A_r)^{-1}B_r)
$$

\n
$$
= (D_l \otimes (C_r(z_rI_{n_r}-A_r)^{-1}))(I_{m_l} \otimes B_r)
$$

\n
$$
= (D_lI_{m_l} \otimes (C_r(z_rI_{n_r}-A_r)^{-1}))(I_{m_l} \otimes B_r)
$$

\n
$$
= (D_l \otimes C_r)(I_{m_l} \otimes (z_rI_{n_r}-A_r)^{-1}))(I_{m_l} \otimes B_r)
$$

\n
$$
= (D_l \otimes I_{p_r})(I_{m_l} \otimes C_r)(I_{m_l} \otimes ((z_rI_{n_r}-A_r)^{-1}))(I_{m_l} \otimes B_r)
$$

\n
$$
= \underbrace{(D_l \otimes I_{p_r})(I_{m_l} \otimes C_r)}_{D_l} (z_rI_{m_ln_r}-I_{m_l} \otimes A_r) \left(\frac{I_{m_l} \otimes B_r}{A_r}\right)
$$

\n
$$
= D_lC_r(z_rI_{m_ln_r}-A_r)^{-1}B_r
$$

 ${}^{2}\text{In}$ matrix theory circles known as the "Kronecker product", see e.g. [\[7,](#page-9-8) Section 4.2].

$$
(C_l(z_lI_{n_l}-A_l)^{-1}B_l)\otimes D_r = (C_l(z_lI_{n_l}-A_l)^{-1}B_l)\otimes D_r)
$$
\n
$$
= (C_l\otimes I_{pr})((z_lI_{n_l}-A_l)^{-1}B_l)\otimes I_{pr}D_r)
$$
\n
$$
= (C_l\otimes I_{pr})(((z_lI_{n_l}-A_l)^{-1}B_l)\otimes I_{pr}D_r)
$$
\n
$$
= (C_l\otimes I_{pr})(((z_lI_{n_l}-A_l)^{-1})\otimes I_{pr})(B_l\otimes D_r)
$$
\n
$$
= (C_l\otimes I_{pr})((z_lI_{n_l}-A_l)^{-1})\otimes I_{pr})B_l\otimes I_{pr}D_r
$$
\n
$$
= (C_l\otimes I_{pr})((z_lI_{n_l}-A_l)^{-1})\otimes I_{pr})B_l\otimes I_{pr}D_r
$$
\n
$$
= (C_l\otimes I_{pr})\left((z_lI_{n_lP} - A_l\otimes I_{pr})\right)^{-1}B_lD_r
$$
\n
$$
= (C_l(z_lI_{n_lP} - A_l)^{-1}B_lD_r)
$$
\n
$$
= (C_l(z_lI_{n_lP}-A_l)^{-1}B_lD_r)
$$
\n
$$
= (C_l(z_lI_{n_lP}-A_l)^{-1}B_lI_{m_l})\otimes (I_{pr}C_r(z_rI_{nr}-A_r)^{-1}B_r)
$$
\n
$$
= (C_l\otimes I_{pr})((z_lI_{n_l}-A_l)^{-1}B_lI_{m_l})\otimes (I_{pr}C_r(z_rI_{nr}-A_r)^{-1})(I_{m_l}\otimes B_r)
$$
\n
$$
= (C_l\otimes I_{pr})((z_lI_{n_l}-A_l)^{-1}B_lI_{m_l})\otimes (I_{pr}C_r(z_rI_{nr}-A_r)^{-1})(I_{m_l}\otimes B_r)
$$
\n
$$
= (C_l\otimes I_{pr})((z_lI_{n_lP}-A_l\otimes I_{pr})B_l\otimes C_r)(I_{m_l}\otimes (z_rI_{n_r-4r})^{-1})(I_{m_l}\otimes B_r)
$$
\n
$$
= (C_l\otimes I_{pr})((z_lI_{n_lP}-A_l\otimes I_{pr})^{-1}(B_l\otimes I_{pr})(I_{m_l}\otimes C_r)(Z_rI_{m_l
$$

 $=$ C₁((z_iI_{nipr} −A₁)⁻¹B₁C_r((z_rI_{minr} −A_r)⁻¹B_r

Thus, one can write

$$
F_l \otimes F_r = \underbrace{D_l \otimes D_r}_{\mathbf{D}} + \left(\begin{array}{cc} \mathbf{C}_l & \mathbf{D}_l \mathbf{C}_r \end{array}\right) \left(\begin{array}{cc} \left((z_l I_{n_l pr} - \mathbf{A}_l\right)^{-1} \left(z_l I_{n_l pr} - \mathbf{A}_l\right)^{-1} \mathbf{B}_l \mathbf{C}_r \left(z_r I_{m_l nr} - \mathbf{A}_r\right)^{-1} \\ \left(z_r I_{m_l nr} - \mathbf{A}_r\right)^{-1} \end{array}\right) \left(\begin{array}{c} \mathbf{B}_l \mathbf{D}_r \\ \mathbf{B}_r \end{array}\right)
$$

$$
= \mathbf{D} + \left(\begin{array}{cc} \mathbf{C}_l & \mathbf{D}_l \mathbf{C}_r \end{array}\right) \left(\begin{array}{cc} z_l I_{n_l pr} & 0 \\ 0 & z_r I_{m_l n_r} \end{array}\right) - \left(\begin{array}{cc} \mathbf{A}_l & \mathbf{B}_l \mathbf{C}_r \\ 0 & \mathbf{A}_r \end{array}\right) \right)^{-1} \left(\begin{array}{c} \mathbf{B}_l \mathbf{D}_r \\ \mathbf{B}_r \end{array}\right).
$$

Note that in particular

$$
D_l \otimes D_r = (D_l I_{m_l}) \otimes (I_{p_r} D_r) = \underbrace{(D_l \otimes I_{p_r})}_{\mathbf{D}_l} \underbrace{(I_{m_l} \otimes D_r)}_{\mathbf{D}_r} = \mathbf{D}_l \mathbf{D}_r = \mathbf{D}.
$$

The realization of $F_l(z_l) \otimes F_r(z_r)$ can be compactly written as

(2.11)
$$
R_{F_l \otimes F_r} = \begin{pmatrix} \mathbf{A}_1 & \mathbf{B}_1 \mathbf{C}_r & \mathbf{B}_1 \mathbf{D}_r \\ 0 & \mathbf{A}_r & \mathbf{B}_r \\ \hline \mathbf{C}_1 & \mathbf{D}_1 \mathbf{C}_r & \mathbf{D}_1 \mathbf{D}_r \end{pmatrix} = \begin{pmatrix} \mathbf{A}_o & \mathbf{B}_o \\ \hline \mathbf{C}_o & \mathbf{D} \end{pmatrix} = \mathbf{R},
$$

which is indeed in form of [\(1.6\)](#page-1-1), [\(2.8\)](#page-2-1). If $z_l = z_r$ and there is no pole-zero cancelation, the sought realization in [\(2.11\)](#page-3-0) is of McMillan degree

$$
n_l p_r + m_l n_r .
$$

Note now that in a way similar to (1.6) , one can factorize the realization in (2.11) as follows,

(2.12)
$$
\mathbf{R} = \begin{pmatrix} \mathbf{A}_{\mathbf{I}} & \mathbf{B}_{\mathbf{I}}\mathbf{C}_{\mathbf{r}} & \mathbf{B}_{\mathbf{I}}\mathbf{D}_{\mathbf{r}} \\ 0 & \mathbf{A}_{\mathbf{r}} & \mathbf{B}_{\mathbf{r}} \\ \hline \mathbf{C}_{\mathbf{I}} & \mathbf{D}_{\mathbf{I}}\mathbf{C}_{\mathbf{r}} & \mathbf{D} \end{pmatrix} = \begin{pmatrix} \mathbf{A}_{\mathbf{I}} & 0 & \mathbf{B}_{\mathbf{I}} \\ 0 & I_{m_{l}n_{r}} & 0 \\ C_{\mathbf{I}} & 0 & \mathbf{D}_{\mathbf{I}} \end{pmatrix} \begin{pmatrix} I_{n_{l}p_{r}} & 0 & 0 \\ 0 & \mathbf{A}_{\mathbf{r}} & \mathbf{B}_{\mathbf{r}} \\ 0 & C_{\mathbf{r}} & \mathbf{D}_{\mathbf{r}} \end{pmatrix}.
$$

We conclude this section by pointing out that Proposition [2.1](#page-2-2) can be easily extended to more elaborate cases like

$$
F_a(z_a) \otimes F_b(z_b) \otimes F_c(z_c) \cdots
$$

3. Realization of the inverse of a tensor product of rational functions

For future reference, in this section we examine the realization of the inverse of rational functions of the form $F_l(z_l) \otimes F_r(z_r)$ studied in the previous section.

We first recall, see e.g. [\[3,](#page-9-6) Theorem 2.4], in the realization of the inverse a rational function: Namely if

$$
R_F = \left(\begin{array}{c|c} A & B \\ \hline C & D \end{array}\right),\,
$$

is a realization of a square matrix-valued rational function $F(z)$, then whenever D is non-singular, $(F(z))^{-1}$ is well-defined almost everywhere, and a corresponding realization is given by,

(3.13)
$$
R_{F^{-1}} = \left(\frac{A^{\times} \mid B^{\times}}{C^{\times} \mid D^{\times}}\right) = \left(\frac{A - BD^{-1}C \mid -BD^{-1}}{D^{-1}C \mid D^{-1}}\right).
$$

Next, whenever the above $F_l(z)$ and $F_r(z)$ are so that

$$
m_l = p_r \qquad \text{and} \qquad p_l = m_r
$$

the product $F_l(z)F_r(z)$ is square, and whenever D_lD_r is non-singular^{[3](#page-4-0)}, $(F_l(z)F_r(z))^{-1}$ is well-defined almost everywhere, and by combining [\(1.6\)](#page-1-1) together with [\(3.13\)](#page-4-1) a corresponding realization is given by

$$
(3.14) \t R_{(F_lF_r)^{-1}} = \begin{pmatrix} A_l^{\times} & 0 & B_l^{\times} \\ B_r^{\times}C_l^{\times} & A_r^{\times} & B_r^{\times}D_l^{-1} \\ \overline{D_r^{-1}C_l^{\times}} & C_r^{\times} & D_r^{-1}D_l^{-1} \end{pmatrix} = \begin{pmatrix} I_{n_l} & 0 & 0 \\ 0 & A_r^{\times} & B_r^{\times} \\ 0 & C_r^{\times} & D_r^{-1} \end{pmatrix} \begin{pmatrix} A_l^{\times} & 0 & B_l^{\times} \\ 0 & I_{n_r} & 0 \\ C_l^{\times} & 0 & D_l^{-1} \end{pmatrix}.
$$

Similarly, whenever

$$
m_l m_r = p_l p_r,
$$

the rational function $F_l(z) \otimes F_r(z)$ is square and if $D_l \otimes D_r = D_l D_r = D$ is non-singular, then D_l , D_r are square, i.e.

$$
m_l = p_l \qquad \qquad m_r = p_r
$$

and non-singular, see e.g. [\[7,](#page-9-8) Theorem 4.2.15]. Thus, we shall denote hereafter by $m_l \times m_l$, $m_r \times m_r$ the dimensions of F_l , F_r , respectively.

Under these conditions, the $m_l m_r \times m_l m_r$ -valued rational function, $(F_l(z) \otimes F_r(z))^{-1}$ is almost everywhere defined. [\(2.11\)](#page-3-0), we next compute the realization of $(F_l \otimes F_r)^{-1}$,

$$
R_{(F_l \otimes F_r)^{-1}} = \begin{pmatrix} (A_l \otimes I_{pr}) - (B_l \otimes D_r)(D_l \otimes D_r)^{-1}(C_l \otimes I_{pr}) & B_l \otimes C_r - (B_l \otimes D_r)(D_l \otimes D_r)^{-1}(D_l \otimes C_r) & -(B_l \otimes D_r)(D_l \otimes D_r)^{-1} \\ -(I_{m_l} \otimes B_r)(D_l \otimes D_r)^{-1}(C_l \otimes I_{pr}) & (I_{m_l} \otimes A_r) - (I_{m_l} \otimes B_r)(D_l \otimes D_r)^{-1}(D_l \otimes C_r) & -(I_{m_l} \otimes B_r)(D_l \otimes D_r)^{-1} \\ (D_l \otimes D_r)^{-1}(C_l \otimes I_{pr}) & (D_l \otimes D_r)^{-1}(D_l \otimes C_r) & (D_l \otimes D_r)^{-1} \end{pmatrix}
$$

³this implies that $m_l = p_r \ge \text{rank}(D_l D_r) = p_l = m_r$.

.

Taking into account the fact that D_l and D_r are square and non-singular, the realization $R_{(F_l\otimes F_r)^{-1}}$ takes the form

$$
R_{(F_l \otimes F_r)^{-1}} = \begin{pmatrix} (A_l - B_l D_l^{-1} C_l) \otimes I_{p_r} & 0 & (-B_l D_l^{-1}) \otimes I_{p_r} \\ \frac{(D_l^{-1} C_l) \otimes (-B_r D_r^{-1})}{D_l^{-1} C_l \otimes D_r^{-1}} & I_{m_l} \otimes (A_r - B_r D_r^{-1} C_r) & D_l^{-1} \otimes (-B_r D_r^{-1}) \\ \frac{D_l^{-1} C_l \otimes D_r^{-1}}{D_l^{-1} C_l \otimes D_r^{-1}} & I_{m_l} \otimes D_r^{-1} C_r & (D_l \otimes D_r)^{-1} \end{pmatrix}
$$

\n
$$
= \begin{pmatrix} A_l^{\times} \otimes I_{p_r} & 0 & B_l^{\times} \otimes I_{p_r} \\ \frac{C_l^{\times} \otimes B_r^{\times}}{C_l \otimes D_r^{-1}} & I_{m_l} \otimes C_r^{\times} & (D_l \otimes D_r)^{-1} \end{pmatrix}
$$

\n
$$
= \begin{pmatrix} A_l^{\times} \otimes I_{p_r} & 0 & (B_l^{\times} \otimes I_{p_r}) \\ \frac{(I_{n_l} \otimes B_r^{\times}) (C_l^{\times} \otimes I_{p_r})}{(I_{n_l} \otimes D_r^{-1}) (C_l^{\times} \otimes I_{p_r})} & I_{m_l p_r} \otimes (I_{m_l} \otimes C_r^{\times}) & (I_{m_l} \otimes D_r^{-1}) (D_l^{-1} \otimes I_{p_r}) \end{pmatrix}
$$

\n
$$
= \begin{pmatrix} A_l^{\times} & 0 & B_l^{\times} \\ \frac{B_r^{\times} C_l^{\times}}{D_r^{-1} C_l^{\times}} & A_r^{\times} & B_r^{\times} D_l^{-1} \end{pmatrix} = \begin{pmatrix} A_o^{\times} & B_o^{\times} \\ \frac{B_o^{\times}}{C_o^{\times}} & D_r^{\times} \end{pmatrix} = \mathbf{R}^{\times},
$$

where the boldface entries are given by

(3.15)
$$
\mathbf{A}_{1}^{\times} := A_{l}^{\times} \otimes I_{p_{r}} \qquad \mathbf{A}_{r}^{\times} := I_{m_{l}} \otimes A_{r}^{\times}
$$

$$
\mathbf{B}_{1}^{\times} := B_{l}^{\times} \otimes I_{p_{r}} \qquad \mathbf{B}_{r}^{\times} := I_{m_{l}} \otimes B_{r}^{\times}
$$

$$
\mathbf{C}_{1}^{\times} := C_{l}^{\times} \otimes I_{p_{r}} \qquad \mathbf{C}_{r}^{\times} := I_{m_{l}} \otimes C_{r}^{\times}
$$

$$
\mathbf{D}_{1}^{-1} = D_{l}^{-1} \otimes I_{p_{r}} \qquad \mathbf{D}_{r}^{-1} = I_{m_{l}} \otimes D_{r}^{-1}
$$

One can conclude that

$$
R_{(F_l \otimes F_r)^{-1}} = R_{(\mathbf{F}_1 \mathbf{F}_r)^{-1}},
$$

.

and in a way similar to [\(2.12\)](#page-3-1), one can factorize the above realization as follows,

$$
(3.16) \qquad \mathbf{R}^{\times} = \begin{pmatrix} \mathbf{A}_{1}^{\times} & 0 & \mathbf{B}_{l}^{\times} \\ \mathbf{B}_{r}^{\times}\mathbf{C}_{1}^{\times} & \mathbf{A}_{r}^{\times} & \mathbf{B}_{r}^{\times}\mathbf{D}_{1}^{-1} \\ \overline{\mathbf{D}_{r}^{-1}\mathbf{C}_{1}^{\times}} & \overline{\mathbf{C}_{r}^{\times}} & \overline{\mathbf{D}_{r}^{-1}\mathbf{D}_{l}^{-1}} \end{pmatrix} = \begin{pmatrix} I_{n_{l}p_{r}} & 0 & 0 \\ 0 & \mathbf{A}_{r}^{\times} & \mathbf{B}_{r}^{\times} \\ 0 & \mathbf{C}_{r}^{\times} & \mathbf{D}_{r}^{-1} \end{pmatrix} \begin{pmatrix} \mathbf{A}_{1}^{\times} & 0 & \mathbf{B}_{1}^{\times} \\ 0 & I_{m_{l}n_{r}} & 0 \\ \mathbf{C}_{1}^{\times} & 0 & \mathbf{D}_{1}^{-1} \end{pmatrix}.
$$

4. Tensor-factorization of rational functions

We now address a more challenging question: Given $\mathbf{F}(z)$ and $(\mathbf{F}(z))^{-1}$ (assuming that det $\mathbf{F}(z) \neq 0$, under what conditions and how, can it be "tensor-factorized" to some $F_l(z)$ and $F_r(z)$, namely the following relation holds,

(4.1)
$$
\mathbf{F}(z) = F_l(z) \otimes F_r(z).
$$

Note that here, we confine the discussion to a single complex variable, i.e. $z_l = z_r = z$. Note also that if [\(4.1\)](#page-5-0) holds, this is true up to complex scaling i.e.,

$$
F_l(z) \otimes F_r(z) = c(z)F_l(z) \otimes \frac{1}{c(z)}F_r(z) \qquad 0 \neq c(z) \in \mathbb{C}.
$$

We shall use this degree of freedom in the sequel.

We next recall in the following fact from matrix theory.

Let Π_{α} , Π_{β} be a pair of supporting projections of the space $\mathbb{C}^{(\alpha+\beta)\times(\alpha+\beta)}$, i.e.

(4.2)
$$
\Pi_{\alpha}^{2} = \Pi_{\alpha} \qquad \Pi_{\alpha} \Pi_{\beta} = 0_{\alpha + \beta} = \Pi_{\beta} \Pi_{\alpha}
$$

$$
\Pi_{\beta}^{2} = \Pi_{\beta} \qquad \Pi_{\alpha} + \Pi_{\beta} = I_{\alpha + \beta} .
$$

Such a pair of projections can be obtained by partitioning an arbitrary non-singular $T \in \mathbb{C}^{(\alpha+\beta)\times(\alpha+\beta)}$ as follows.

(4.3)

$$
T^{-1} \begin{pmatrix} I_{\alpha} & 0 \\ 0 & 0_{\beta} \end{pmatrix} T := \Pi_{\alpha}
$$

$$
T^{-1} \begin{pmatrix} 0_{\alpha} & 0 \\ 0 & I_{\beta} \end{pmatrix} T = \Pi_{\beta}.
$$

By using an isometry-like relation, we next offer a simple way to "deflate" matrix dimensions.

Observation 4.1. Given $M \in \mathbb{C}^{s \times q}$, denote

$$
\mathbf{M}_{\mathbf{l}} := M \otimes I_p \qquad \quad \mathbf{M}_{\mathbf{r}} := I_m \otimes M.
$$

For arbitrary $u \in \mathbb{C}^p$, $v \in \mathbb{C}^m$ normalized so that $u^*u = 1$, $v^*v = 1$, one has that

 $(I_s \otimes u^*) \mathbf{M}_1 (I_q \otimes u) = M$ and $(v^* \otimes I_s) \mathbf{M}_r (v \otimes I_q) = M$.

Indeed, by twice applying [\(2.10\)](#page-2-3) one obtains,

$$
(I_s \otimes u^*) \underbrace{(M \otimes I_p)}_{\mathbf{M}_1} (I_q \otimes u) = (I_s M I_q) \otimes \underbrace{(u^* I_p u)}_{=1} = M
$$

$$
(v^* \otimes I_s) \underbrace{(I_m \otimes M)}_{\mathbf{M}_r} (v \otimes I_q) = \underbrace{(v^* I_m v)}_{=1} \otimes (I_s M I_q) = M.
$$

We next apply the last observation to the variables here.

Corollary 4.2. For $u \in \mathbb{C}^{p_r}$, $v \in \mathbb{C}^{m_l}$, normalized so that $u^*u = 1$ and $v^*v = 1$, the boldface characters in [\(2.8\)](#page-2-1) satisfy

$$
A_l = (I_{n_l} \times u^*) \mathbf{A}_l (I_{n_l} \otimes u) \qquad A_r = (v^* \otimes I_{n_l}) \mathbf{A}_r (v \otimes I_{n_r})
$$

\n
$$
B_l = (I_{n_l} \times u^*) \mathbf{B}_l (I_{m_l} \otimes u) \qquad B_r = (v^* \otimes I_{n_l}) \mathbf{B}_r (v \otimes I_{m_r})
$$

\n
$$
C_l = (I_{p_l} \times u^*) \mathbf{C}_l (I_{n_l} \otimes u) \qquad C_r = (v^* \otimes I_{p_l}) \mathbf{C}_r (v \otimes I_{n_r})
$$

\n
$$
D_l = (I_{p_l} \times u^*) \mathbf{D}_l (I_{m_l} \otimes u) \qquad D_r = (v^* \otimes I_{p_l}) \mathbf{D}_r (v \otimes I_{m_r}).
$$

We now return to the problem of "tensor-factorization" in (4.1) . We note that in place of **R** in [\(2.11\)](#page-3-0) and \mathbb{R}^{\times} in [\(3.16\)](#page-5-1), the realization arrays associated with **F** and \mathbb{F}^{-1} , are known only up to a coordinate transformation, i.e. there exists, a non-singular matrix $T \in \mathbb{C}^{(n_l p_r + m_l n_r) \times (n_l p_r + m_l n_r)}$ namely in [\(4.2\)](#page-5-2) and [\(4.3\)](#page-6-0)

$$
\alpha = n_l p_r
$$
 and $\beta = m_l n_r$,

so that the actual realization array is given by

(4.4)
$$
\begin{pmatrix} T & 0 \\ 0 & I_{p_{l}m_{r}} \end{pmatrix}^{-1} \mathbf{R} \begin{pmatrix} T & 0 \\ 0 & I_{p_{l}m_{r}} \end{pmatrix} = \begin{pmatrix} T^{-1} \mathbf{A_{o}} T & T^{-1} \mathbf{B_{o}} \\ \hline \mathbf{C_{o}} T & \mathbf{D} \end{pmatrix} = \begin{pmatrix} \mathbf{A} & \mathbf{B} \\ \hline \mathbf{C} & \mathbf{D} \end{pmatrix},
$$

and

(4.5)
$$
\begin{pmatrix} T & 0 \\ 0 & I_{p_1m_r} \end{pmatrix}^{-1} \mathbf{R}^{\times} \begin{pmatrix} T & 0 \\ 0 & I_{p_1m_r} \end{pmatrix} = \begin{pmatrix} T^{-1} \mathbf{A_o}^{\times} T & T^{-1} \mathbf{B_o}^{\times} \\ \hline \mathbf{C_o}^{\times} T & \mathbf{D}^{-1} \end{pmatrix} = \begin{pmatrix} \mathbf{A}^{\times} & \mathbf{B}^{\times} \\ \hline \mathbf{C}^{\times} & \mathbf{D}^{-1} \end{pmatrix}.
$$

As in reality, the specific coordinate transformation, T in (4.4) and (4.5) is unknown one can conclude that to extract $F_l(z)$ and $F_r(z)$ from [\(4.1\)](#page-5-0) along with the realization arrays in [\(4.4\)](#page-6-1), [\(4.5\)](#page-6-2), additional conditions are needed.

Theorem 4.3. Let $F(z)$ be a given square matrix-valued rational function. Assume that

$$
\lim_{z \to \infty} \mathbf{F}(z) = I.
$$

Let $\left(\begin{array}{c|c}\nA & B \\
\hline\nC & I\n\end{array}\right)$ \overline{C} \overline{I} , see [\(4.4\)](#page-6-1), and $\left(\begin{array}{c|c}\nA^{\times} & B^{\times} \\
\hline\nC^{\times} & I\n\end{array}\right)$ $\overline{\mathbf{C}^{\times}}$ *I* \setminus . see [\(4.5\)](#page-6-2), be realizations of $F(z)$ and of $(F(z))^{-1}$, respectively.

Substituting in [\(4.2\)](#page-5-2), $\alpha = n_l m_r$ and $\beta = m_l n_r$, assume also that there exists a pair of supporting projection to $\mathbb{C}^{n_l m_r+m_l n_r}$ denoted by $\Pi_{n_l m_r}$ and $\Pi_{m_l n_r}$ so that

(4.6)
$$
\mathbf{A}\Pi_{n_l m_r} = \Pi_{n_l m_r} \mathbf{A}\Pi_{n_l m_r} \qquad \mathbf{A}^{\times} \Pi_{m_l n_r} = \Pi_{m_l n_r} \mathbf{A}^{\times} \Pi_{m_l n_r} .
$$

Following the definition of the projections $\Pi_{n_l m_r}$ and $\Pi_{m_l n_r}$, see [\(4.3\)](#page-6-0) and [\(4.6\)](#page-7-0), along with Corollary [4.2,](#page-6-3) for arbitrary $u \in \mathbb{C}^{m_r}$, $v \in \mathbb{C}^{m_l}$, normalized so that $u^*u = 1$ and $v^*v = 1$, we find it convenient to introduce the following related projections^{[4](#page-7-1)},

(4.7)
$$
\hat{\Pi}_{n_l m_r} = T^{-1} \begin{pmatrix} I_{n_l} \otimes u u^* & 0 \\ 0 & 0_{m_l n_r} \end{pmatrix} T \qquad \hat{\Pi}_{m_l n_r} = T^{-1} \begin{pmatrix} 0_{n_l m_r} & 0 \\ 0 & v v^* \otimes I_{m_l} \end{pmatrix} T
$$

Then, using [\(2.11\)](#page-3-0) and [\(4.4\)](#page-6-1), one can take in [\(4.1\)](#page-5-0) $\mathbf{F} = F_l \otimes F_r$ where,

$$
F_l(z) = (I_{m_l} \otimes u^*) \mathbf{C} \hat{\Pi}_{n_l m_r} (zI_{n_l m_r + m_l n_r} - \mathbf{A})^{-1} \hat{\Pi}_{n_l m_r} \mathbf{B} (I_{m_l} \otimes u) + I_{m_l}
$$

$$
F_r(z) = (v^* \otimes I_{m_r}) \mathbf{C} \hat{\Pi}_{m_l n_r} (zI_{n_l m_r + m_l n_r} - \mathbf{A})^{-1} \hat{\Pi}_{m_l n_r} \mathbf{B} (v \otimes I_{m_r}) + I_{m_r}
$$

Proof : First, recall (see Section [3\)](#page-4-2) that the assumption that $D_l \otimes D_r = D_l D_r = D_l$ is square non-singular, it implies that both D_l and D_r are square non-singular. We shall thus denote the dimensions of F_l and F_r , by $m_l \times m_l$ and $m_r \times m_r$, respectively.

The assumption here that $\mathbf{D} = I_{m_l m_r}$ implies (see e.e. [\[7,](#page-9-8) Theorem 4.2.12]) that

$$
D_l = cI_{m_l}
$$
 $D_r = \frac{1}{c}I_{m_r}$ for some non-zero $c \in \mathbb{C}$.

As already mentioned after [\(4.1\)](#page-5-0), to simplify the exposition we shall take $c = 1$.

Next, let T in [\(4.3\)](#page-6-0), [\(4.4\)](#page-6-1), [\(4.5\)](#page-6-2) be the same so that the supporting projections are $\Pi_{n_l m_r}$ and $\Pi_{m_l n_r}$. Next note that substituting (2.11) , (3.16) , (4.4) and (4.5) in condition (4.6) yields,

$$
\mathbf{A}\Pi_{n_l m_r} = T^{-1} \begin{pmatrix} \mathbf{A}_1 & 0 \\ 0 & 0_{m_l n_r} \end{pmatrix} T \qquad \Pi_{m_l n_r} \mathbf{A} = T^{-1} \begin{pmatrix} 0_{n_l m_r} & 0 \\ 0 & \mathbf{A}_r \end{pmatrix} T
$$

$$
\mathbf{A}^{\times} \Pi_{m_l n_r} = T^{-1} \begin{pmatrix} 0_{n_l m_r} & 0 \\ 0 & \mathbf{A}_r^{\times} \end{pmatrix} T \qquad \Pi_{n_l m_r} \mathbf{A}^{\times} = T^{-1} \begin{pmatrix} \mathbf{A}_1^{\times} & 0 \\ 0 & 0_{m_l n_r} \end{pmatrix} T
$$

and thus in the sequel we shall use the two upper relations, i.e.

$$
\Pi_{n_l m_r} \mathbf{A} \Pi_{n_l m_r} = T^{-1} \begin{pmatrix} \mathbf{A}_1 & 0 \\ 0 & 0_{m_l n_r} \end{pmatrix} T \qquad \qquad \Pi_{m_l n_r} \mathbf{A} \Pi_{m_l n_r} = T^{-1} \begin{pmatrix} 0_{n_l m_r} & 0 \\ 0 & \mathbf{A}_r \end{pmatrix} T.
$$

⁴note that $\hat{\Pi}_{n_l m_r} \Pi_{n_l m_r} = \hat{\Pi}_{n_l m_r} \Pi_{n_l m_r}$ and $\hat{\Pi}_{m_l n_r} \Pi_{m_l n_r} = \Pi_{m_l n_r} \hat{\Pi}_{m_l n_r} = \hat{\Pi}_{m_l n_r}$.

We are now ready to recover $F_l(z)$,

$$
F_{l}(z) = C_{l} (zI_{n_{l}} - A_{l})^{-1} B_{l} + I_{m_{l}}
$$
\n
$$
= \underbrace{(I_{m_{l}} \otimes u^{*}) \mathbf{C}_{l} (I_{n_{l}} \otimes u) \underbrace{(I_{n_{l}} \otimes u^{*}) (zI_{n_{l}m_{r}} - \mathbf{A}_{l})^{-1} (I_{n_{l}} \otimes u) \underbrace{(I_{n_{l}} \otimes u^{*}) \mathbf{B}_{l} (I_{m_{l}} \otimes u)}_{(zI_{n_{l}} - A_{l})^{-1}} + I_{m_{l}}
$$
\n
$$
= (I_{m_{l}} \otimes u^{*}) \mathbf{C}_{l} (I_{n_{l}} \otimes uu^{*}) (zI_{n_{l}m_{r}} - \mathbf{A}_{l})^{-1} (I_{n_{l}} \otimes uu^{*}) \mathbf{B}_{l} (I_{m_{l}} \otimes u) + I_{m_{l}}
$$
\n
$$
= (I_{m_{l}} \otimes u^{*}) \mathbf{C}_{o} \left(\underset{0_{m_{l}n_{r}} \times n_{l}m_{r}}{I_{n_{l}m_{r}}} \right) (I_{n_{l}} \otimes uu^{*}) (I_{n_{l}m_{r}} - \mathbf{A}_{l})^{-1} (I_{n_{l}} \otimes uu^{*}) \mathbf{B}_{l} (I_{m_{l}} \otimes u) + I_{m_{l}}
$$
\n
$$
\times \left(\underset{0_{m_{l}n_{r}} \times n_{l}}{I_{n_{l}m_{r}}} \right) (I_{n_{l}} \otimes uu^{*}) \mathbf{B}_{l} (I_{m_{l}} \otimes u) + I_{m_{l}}
$$
\n
$$
= (I_{m_{l}} \otimes u^{*}) \mathbf{C}_{o} \left(\underset{0_{m_{l}n_{r}} \times n_{l}}{I_{n_{l}m_{r}}} \right) (zI_{n_{l}m_{r} + m_{l}n_{r}} - \mathbf{A}_{o})^{-1} \left(\underset{0_{m_{l}n_{r}} \times n_{l}}{I_{n_{l}m}} \right) \mathbf{B}_{o} (I_{m_{l}} \otimes u) + I_{m_{l}}
$$
\n
$$
= (I_{m_{l}} \otimes u^{*}) \mathbf{C}_{o} \left(\underset{0_{m_{l}n
$$

$$
= \underbrace{(v^* \otimes I_{m_r}) \mathbf{C}_{\mathbf{r}}(v \otimes I_{n_r})}_{C_r} \underbrace{(v^* \otimes I_{n_l})(zI_{n_r} - \mathbf{A}_{\mathbf{r}})^{-1}(v \otimes I_{n_r})}_{(zI_{n_r} - A_r)^{-1}} \underbrace{(v^* \otimes I_{n_l}) \mathbf{B}_{\mathbf{r}}(v \otimes I_{m_r})}_{B_r} + I_{m_r}
$$
\n
$$
= (v^* \otimes I_{m_r}) \mathbf{C}_{\mathbf{r}}(vv^* \otimes I_{m_l})(zI_{n_r} - \mathbf{A}_{\mathbf{r}})^{-1}(vv^* \otimes I_{m_l}) \mathbf{B}_{\mathbf{r}}(v \otimes I_{m_r}) + I_{m_r}
$$
\n
$$
= (v^* \otimes I_{m_r}) \mathbf{C}_{\mathbf{o}} \left(\begin{array}{c} 0_{n_1m_r \times m_1n_r} \\ I_{m_1n_r} \end{array} \right) (vv^* \otimes I_{m_l}) (0_{m_1n_r \times n_1m_r} I_{m_1n_r}) (zI_{n_1m_r + m_1n_r} - \mathbf{A}_{\mathbf{o}})^{-1}
$$
\n
$$
\times \left(\begin{array}{c} 0 \\ I_{m_1n_r} \end{array} \right) (vv^* \otimes I_{m_l}) (0 I_{m_ln_r}) \mathbf{B}_{\mathbf{o}}(v \otimes I_{m_r}) + I_{m_r}
$$
\n
$$
= (v^* \otimes I_{m_r}) \underbrace{\mathbf{C}_{\mathbf{o}} T T^{-1} \left(\begin{array}{c} 0_{n_1m_r} \\ 0 \end{array} \right) T T^{-1} (zI_{n_1m_r + m_1n_r} - \mathbf{A}_{\mathbf{o}})^{-1} T T^{-1} \left(\begin{array}{c} 0_{n_1m_r} \\ 0 \end{array} \right) T}{(zI_{n_1m_r + m_1n_r} - \mathbf{A})^{-1}} \underbrace{\mathbf{T}^{-1} \left(\begin{array}{c} 0_{n_1m_r} \\ 0 \end{array} \right) T}{\mathbf{\hat{n}}_{m_ln_r}}
$$
\n
$$
\times \underbrace{T^{-1} \mathbf{B}_{\mathbf{o}}(v \otimes I_{m_r}) + I_{m
$$

 $\hat{H} = (v^* \otimes I_{m_r}) \hat{\text{CI}}_{m_l n_r} (z I_{n_l m_r + m_l n_r} - \textbf{A})^{-1} \hat{\Pi}_{m_l n_r} \textbf{B}(v \otimes I_{m_r}) + I_{m_r} \;.$

 \Box

Remark 4.4. At first sight, the assumptions in Theorem [4.3](#page-7-2) seem very restrictive. For persective recall that to factorize a given rational function $F(z)$ to $F(z) = F_l(z)F_r(z)$, the assumptions are virtually the same^{[5](#page-9-9)}, see [\[3,](#page-9-6) Section 2.5]).
